

On & Offshore; *The areas for Rope Access*

Looking at offshore structures, large buildings, gigantic structures, bridges, offshore platforms, chimneys and even roller coasters from ground or sea level up, you can find numerous locations which are difficult or impossible to reach by technicians or inspectors. This is where Bluestream Rope Access technicians are called in for their special services.

Rope Access is a technique where specially trained technicians reach their work

location with the aid of ropes. The ropes come instead of ladders, platforms and scaffolding generally used.

When these areas are reached by using the Rope Access technique many different activities can be executed. Areas can be inspected, parts can be repaired and do not forget the maintenance, it is all possible while using the rope access technique. Our rope access technicians are qualified inspectors, welders and other

trades, who are trained in rope access techniques according IRATA (International Rope Access Trade Association) standards. Therefore all activities are executed by skilled personnel who are able to reach their work location with rope access techniques.

Various small and large projects are executed by Bluestream Rope Access technicians. Riser installations, platform structural inspections, antenna installations are all part of the

large portfolio of Bluestream Rope Access. Bluestream Rope Access provides rope access services for the entire offshore and the onshore sector in the Netherlands as well as abroad.

Bluestream Rope Access is active since the early nineties and specialized in assisting clients finding and accomplish the most efficient solutions for their challenges.

And there is more; www.bluestreamoffshore.com will give you further information or call the head office in Den Helder 0031 (0)223 63 77 84, it is our pleasure to assist!
